Controlled Fourdrinier Watermark Substrate

**U.V. Dull and
Fluorescent Fibers**

**Safelimage Over Light Table Shows
Unique Watermarked Images**

Chemical Protection

Security Paper has taken on many forms and definitions today which makes purchasing confusing for someone who wants true security. Years ago ISP understood that all the features within security paper do not offer true security unless the substrate is controlled. ISP realized that it must create a unique true watermark substrate that we would never sell generically but only through our secure chain of custody. We designed our own dandy roller and included the highest protection properties commonly utilized in secure substrates. Along with our control these properties are as follows:

Unique fourdrinier watermarked images, visible red and blue fibers, U.V. dull, invisible fluorescent fibers, chemical attack protection to 5 chemicals for over 60 minutes, and toner anchorage for bonding laser applied print.
